and their structural isomers and stereoisomers, in particular tautomers, diastereomers and enantiomers, and their pharmaceutically acceptable salts, in particular acid addition salts, are provided.

Thus, for example, the compounds of the formula (1) according to the invention which have one or more centers of chirality and which are present as racemates can be separated by methods known per se into their optical isomers, i.e. enantiomers or diastereomers. Furthermore, the quinoline derivatives of the formula (1) according to the invention can be converted into their salts with inorganic or organic acids, in particular, for pharmaceutical use, into their physiologically acceptable salts. Acids which are suitable for this purpose are, for example, hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, fumaric acid, succinic acid, lactic acid, citric acid, acetic acid, tartaric acid, malic acid, embonic acid, malonic acid, trifluoroacetic acid or maleic acid.

water-in-oil emulsions. Suitable liquid preparations are, for example,
sterile aqueous preparations for parenteral administration which are
15 isotonic with the blood of the patient.

1-(3,5-dimethoxyphenyl)-4-(4-quinolyl-carbonyl)piperazine

2 g (11.5 mmol) of quinoline-4-carboxylic acid were suspended in 80 ml of DMF. With stirring, 1.74 g (17.2 mmol) of N-methylmorpholine and then a solution of 8.95 g (17.2 mmol) of Py-BOP (1-benzotriazolyltripyrrolidinophosphonium hexafluorophosphate) and 2.56 g (11.5 mmol) of 1-(3,5-dimethoxyphenyl)piperazine in 25 ml of DMF were added to this mixture. The mixture was stirred at RT for 12 h, the DMF was distilled off under reduced pressure and the residue was purified on a silica gel column (Kieselgel 60, from Merck AG, Darmstadt) using the mobile phase dichloromethane/methanol/25 percent ammonia (90:10:1 v/v/v).
